

ProcureSource

Built by The Lycoris Labs

PRODUCT DOCUMENTATION

Industrial procurement intelligence with a defensible verification core.

ProcureSource is a Next.js platform for MEP and industrial procurement across the GCC, focused on verified supplier records, technical product data, RFQs, certifications, submittals, contracts, deliveries, messaging, and role-based operations.

66

application pages
currently present

77

API route files currently

126

static/dynamic routes
generated in the latest
build

What This Product Is

ProcureSource is positioned as a technical procurement operating system for industrial and MEP equipment. It connects purchase managers, suppliers, manufacturers, agents, and admins around verified product records, RFQs, quotes, contracts, documents, delivery tracking, and technical compliance.

Primary Users

- Purchase managers creating projects and RFQs.
- Suppliers managing products, brands, quotes and invitations.
- Admins reviewing users, products, suppliers and documents.
- Public users browsing products, manufacturers, RFQs and certifications.

Core Differentiator

The latest work moves the product beyond a generic marketplace by adding a manual trust layer: verification trails, agent authorization mapping, mismatch alerts, response-time evidence, lead-time reality checks, and honest spec confidence.

Strategic wedge: v1 should stay narrow around verified chiller intelligence and UAE/GCC agent authorization before broad marketplace expansion.

Major Product Areas Built

Public Discovery

Homepage, manufacturers, agents, products, product detail, compare, RFQs, search, certifications, support, legal and static company pages.

Authentication

Email/password login, registration, email verification, password reset, document upload hooks, role-based dashboard redirect.

Purchase Manager Workflows

PM dashboard, projects, project details, RFQ detail, contracts, project documents, supplier selection and spec analysis route.

Supplier Workflows

Supplier dashboard, brand/product management, import/export templates, RFQ invitations, quote building, contracts and analytics.

Admin Workflows

Admin auth, supplier/product/category/brand/equipment management, document review, analytics, user/team oversight and flags.

Collaboration

Messaging, conversations, unread counts, notifications, deliveries, delivery events, contracts and connection requests.

How The App Is Structured

Layer	Current Implementation
Frontend	Next.js 15 App Router, React 19, Tailwind CSS 4, Framer Motion, Lucide icons, local DM Sans and Manrope fonts.
Backend	Next.js API routes under src/app/api with MongoDB/Mongoose models, JWT auth cookies, Cloudinary uploads, Nodemailer email flows.
Data Models	User, Supplier, SupplierProduct, Brand, Product, RFQ, Quote, Contract, Delivery, Project, ProjectSpecMatch, Message, Notification, ConnectionRequest, UserDocument and VerificationRecord.
AI Provider	Azure OpenAI gpt-4o is wired through src/lib/ai.ts with API key or Azure AD token fallback, JSON parsing and deterministic local fallback.
SEO/GEO	Root metadata, canonical rules, robots.txt, sitemap.xml, PWA manifest, structured JSON-LD, GCC market pages and global landing pages.

Trust Layer Added In This Pass

Verification Trail

Certificate records now support verified-on dates, next review dates, evidence methods, outcomes and sources.

Mismatch Alerts

Lookup can show not-found or mismatch states instead of falsely displaying a generic verified badge.

Agent Authorization Map

Records include agent name, region, status, confirmation method, response-time history and introduction contact path.

Lead Time Reality Check

Records distinguish claimed lead time from observed project delivery data when samples exist.

Spec Confidence

Spec matcher now returns requirement-level status, confidence and evidence, plus region-aware flags.

Data Model

VerificationRecord model added for real Mongo-backed trust data, with local seeded examples as fallback.

Visual System Updates

Logo

A new original geometric source mark was created and wired into the navbar, favicon assets, app icons, manifest and structured data.

Typography

The application and documentation use local DM Sans and Manrope only, removing external Google Fonts runtime dependency.

Auth Screens

Login and registration now use a responsive split-screen shell on desktop and compact trust context cards on mobile.

Responsive QA

Mobile audit covers homepage, products, RFQs, AI tools, auth, dashboard shells, and new market/global pages across 360px, 375px and 390px widths.

Brand attribution is now standardized as Built by The Lycoris Labs.

What Was Tested

Check	Result
Production build	Passed. Next.js generated 126 routes.
Mobile audit	Passed. 36 checks across 12 routes and 3 phone widths.
Public routes	Homepage, login, register, certification lookup, market/global pages, robots, sitemap, manifest and favicon assets returned 200.
AI routes	Spec analysis returns category, matches, requirement confidence and region flags. Submittal route returns document list and highlights.
Certificate lookup	Verified and mismatch records return deterministic evidence-based responses.
Auth resilience	Local sandbox cannot reach MongoDB SRV, so auth now returns clean 503 service-unavailable handling instead of leaking database internals.

Deployment note: real login/signup requires reachable MongoDB, SMTP and Cloudinary environment variables in Vercel.

Recommended Roadmap

Phase 0

Lock v1 to UAE chillers, build the manufacturer/agent/certificate spreadsheet, and seed VerificationRecord with real manual evidence.

Phase 1

Expose the public certification lookup and verified agent introduction flow to a small group of real consultants.

Phase 2

Only after real usage, expand admin tooling for manufacturer self-updates, verification review queues and quarterly re-check cadence.

Do Not Rush

Do not expand categories, payment workflows, complex RFQ automation, BIM integration or mobile apps before the trust dataset has density.
